<b>Abstract</b>	<p>Environment and corruption are two very popular concepts in the last few decades. Both reflect on the negative side in society. Environmental issues are becoming popular because of many environmental problems that arise not only locally, regionally or nationally but also in the international level. Likewise, corruption is widely discussed and demonstrated especially in Indonesia since the reform era, 1998. The relationship between environment and corruption is more of a causal relationship, where the environment plays a role, while corruption is the cause. The form of corruption that causes environmental damage is; 1) granting permission from regional heads to entrepreneurs who are bribed, so that provisions in the licensing process are not considered properly; 2) corruption in the Amdal process, in which employers give bribes to the parties involved in the Amdal process; 3) corruption of illegal levies against entrepreneurs so that entrepreneurs make compensation calculations by way of externality of production costs to the environment, as a consequence of high costs borne by the entrepreneurs. Some examples of corruption cases show the corruption of a certain kind has made the environment a victim. The environmental aspect should be considered in the judicial process of corruption cases that have an impact on the environment, so the public's concern for the environment is getting stronger.</p>
