Abstract	The economic structural change on the output side is accompanied by the reallocation of labour from the agricultural sector to the industrial sector. Some studies show the different effects of labour reallocation on labour productivity growth. This study analyses labour productivity growth in the manufacturing sector in relation to economic structural changes in Indonesia. The analytical methods used are shift-share and panel data regression models using secondary data of 30 provinces from 2003-2014. The results show economic structural change through labour reallocation decreases growth of labour productivity (structural burden) although productivity continues to grow.
