<b>Abstract</b>	<p>ABSTRACT Decline of global economic conditions are impact on industrial sectors, especially the industries whose products are exported to developed countries and developing countries. These conditions, more employers will do efficiency and focuses on efforts to overcome the problem of capital management and marketing. Occupational health and safety is a part that requires a high cost for the company so it is not important in the current economic. One of neglected component is fatigue on the worker. Therefore, researchers wanted to conduct research about the relationship between Hb levels with fatigue on the female workers in PT. HyupSung Purbalingga. The results of bivariate analysis is obtained p value = 0.075 &gt; 0.05. This indicates that there is no significant relationship between Hb levels with fatigue. This is probably caused by Hb workers are still in the normal category, so the possibility of fatigue is caused by other factors. As for suggestions for this research is need for the application of ergonomic principles in working facilities such as tables, chairs, to reduce health problems at the waist and back. The need for increased knowledge about the importance of nutrition for the workers. The need of training fatigue management to problem solving of fatigue on the worker.
