<b>Abstract</b>	<p>In building healthy elderly people were not easy and need team work from many sector for instance: elderly themselves, families, communities, government, non government organization, health professional groups. Integrated health services for elderly were health services for elderly in health promotion aspect. The aim was to promote health degree and quality of life to gain old age that be happy and meaningful in their families and their communities. The research object was found out some factor influencing elderly to present at integrated health services in Kebumen Baturraden Of Banyumas District. This researches fall in survey researches by cross sectional approach. The research population is all elderly people in Kebumen Baturraden (722) people. Descriptive research findings shows that respondents that have near distances from their house to integrated health service are 69.4% illiterate respondent and not finish from elementary school are 60.0%, 25.9% and 14.1%. Knowledge level of respondents show that almost the same between good knowledge and not enough good knowledge (50.6% and 49.4% respectively). Psychosocial potential of respondents are middle category (36.5%). And prevalence of active elderly at integrated health services are 28.24% and 71.76% for passive. Analytic statistical shown that distance, level of knowledge, and psychosocial potential have a significant influence toward prevalence elderly to integrated health services (<math>p=0.034</math>, <math>p=0.020</math>, <math>p=0.185</math>). It hopes that every elderly people could present at integrated health services periodically (i.e: monthly) and needs increasing number of integrated health services, at least one integrated health services every citizen areas, and also increasing the frequency of health promotion program by staff of health community center as supervisor of activities for elderly integrated health services.</p>
