<b>Abstract</b>	Study on magnetic properties of iron sand on the Logending beach sand has been done. The research aims to identify the mineral content and characterization of magnetic properties on the Logending beach sand. The iron sand samples taken from the Logending beach with several location. Sand then dried, determined density and magnetic content is separated using a permanent magnet. The iron sand were analyzed using XRD ( X-ray diffraction) and characterization of magnetic properties using the VSM (Vibrating sample magnetometer). The research shows that minerals are contained hematite ( $Fe_2O_3$ ), with a value of susceptibility is $0.43 \times 10^{-6} m^3/kg$ . The main magnetic mineral of iron sand from logending beach is paramagnetic.
