<b>Abstract</b>	<p>Background: In an effort to provide health service access to its students, University of Jenderal Soedirman develops a scheme of health insurance in the program of student healthcare assistance during academic year 2006/2007. During this period there were some problems which caused the scheme unable to cover all needs of students for health services. It is expected that next time there is development in health service package and premi calculation in order that the program of student health care assistance can operate better. Objective: To develop alternative health service package and rational premi calculation for the implementation of student healthcare assistance based on the coverage of participation at the University of Jenderal Soedirman in the future. Method: This case study used complementary qualitative and quantitative approach. Major research design was quantitative. Result: Service package of Soedirman Health Center for the program of student health care assistance included primary outpatient, continuing outpatient and inpatient health services with particular limitation either on cost or length of stay. Unit cost calculation of primary outpatient health service at Student Health Center for Medication clinic was Rp24,423 and for Dental Medication clinic was Rp96,387. Premi calculation was made using actual utilization for Student Health Center as much as Rp6.180/student/semester and for Purbalingga Community Health Care Insurance was Rp67.062/student/semester. Conclusion: The establishment of health service package and rational premi calculation should enable the development of health insurance program for students of the University of Jenderal Soedirman and become an instrument for advocacy for the policy makers in developing the program in the future. Keywords: health service packages, premi calculation, unit cost</p>
