Abstract	<p>This study analyzed the influence of several factors such as the role of facilitator, variation of counseling methods, media exposure, parent-adolescent communication, perceived vulnerability, seriousness about reproductive health and the assessment of reproductive health threat towards preventive behaviors of adolescent reproductive health in Banyumas. The study used mixed method with quantitative research as the dominant approach and supported by qualitative research in the unity of research design. The sample unit is 149 members of Adolescent Counseling Club group (PIK) taken with census techniques in Banyumas. The results showed that adolescent reproductive health preventive behavior with some indicators: adolescent often checked reproductive health, refused to have sex before marriage, and prevented sexually transmitted diseases (STDs), affected directly and significantly ($p < 0.05$) by the variable assessment (confidence and awareness) on the health threats with the magnitude of the effect of 0.517. Significantly, some variables, the role of facilitator, variation of counseling methods, media exposure, and parent-adolescent communication, are influencing directly and indirectly preventive reproductive health behavior variable, because it should pass the assessment of reproductive health threat variable. It means that clues of action variables could improve confidence and awareness on reproductive health threat, and then became the stimulus for the establishment of preventive behavior of adolescent reproductive health.</p>
