Abstract	The Alligator gar, <i>Atractosteus spatula</i> (Lacepède, 1803), is a high-predatory fish native to North America. In 2020, two specimens were captured as a new species in the public waters of Klawing River, Central Java, Indonesia at 7°19'27"S 109°20'10"E. Therefore, this study aims to describe the meristic and morphometric features of <i>Atractosteus spatula</i> based on an in-situ observation in the river.
